

**NEW PRODUCT ANNOUNCEMENT**

Energy Efficient System Now Available With Recycled Content

Innotech is pleased to announce that Natural White and Café Latté (beige) InnoNova window frame and sash profiles are now being extruded with a core of recycled rigid uPVC.

Innotech manufactures a Hybrid (Galvanized Steel + uPVC) window and door system using TROCAL brand unplasticized rigid uPVC profiles from the Profine International Profile Group, the world's largest producer of uPVC window profiles. The introduction of recycled content is part of Profine's ongoing GreenLine initiative.

The recycled content comes from Profine internal manufacturing operations to ensure the purity and quality of the profiles is not compromised. The recycled content makes up about 70% of the profiles by weight.

The profiles available with recycled cores are the main frame (510306) and the window sash (520606). The recycled materials have a grayish color as shown in the illustration above.

The recycled core is available on Natural White and Café Latté (beige) profiles only. AcrylProtect profiles will continue to be produced with virgin uPVC.

The new profiles are named **recycline** and are as strong and durable as Profine's virgin uPVC.

Innotech is committed to producing high quality, energy-efficient and long-lasting products that are well-suited for sustainable buildings. The introduction of Recycline is one more step towards a more sustainable future.
